Build a Price?Alert Bot

Track any product, get email when it drops

Choose the Site

> Open the product page in a browser. > Right?click > Inspect to find the price element's CSS selector. Claude helps translate that into code.

Write the Fetcher

Claude generates a short Python script that requests the page and extracts the price using the selector. No libraries beyond requests and BeautifulSoup.

Set the Threshold

Add a single line:?if price < 150: trigger email. Replace 150 with your own target price in RM.

Schedule the Check

Claude creates a cron entry (*/10 * * * *) to run the script every 10?minutes on Glitch's free tier.

Send the Email

Use Python's smtplib to send a plain?text email to your inbox. Claude fills in the SMTP settings for a free Gmail account.
